

ABSTRACT

Desired signal power measured at a desired
signal power measuring circuit 105 is averaged over
a plurality of slots by an averaging circuit 106 to
5 reduce a power error in desired signal power of each
slot. An SIR measuring circuit 108 calculates
SIR(n) of each slot from the average value of desired
signal power in the plurality of slots and the
measured value of interference signal power of each
10 slot, and a TPC generating circuit 109 makes a
comparison between SIR(n) of each slot and a
threshold value, and generates transmission power
control information. This makes it possible to
control transmission power for each slot with high
15 accuracy in asymmetrical communication.
